```
The peptide has corpus luteum hormone (LH) and follicle stimulating hormone (FSH) activity. It is thus useful for treating hypogonadotropic hypogonadism. It can be prepd. by extn. of chicken hypothalamus or by chemical reaction. (Updated on 25-MAR-2003 to correct PA field.) (Updated on 24-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         8 Different forms of GnRH (given in AAR75152-59) have previously been isolated from vertebrate species. A precursor for an additional form of GnRH, (Ser8)-GnRH (AAR75151), has now been obtd

This sequence represents a chicken gonadotrophin-releasing hormone (GRRH), which is used in a method for producing long-term contraception or sterility by administering GRRH, beta luteinising hormone (LH) or lamprey-luteinising hormone (1-LHRH-III) or temporarily restoring fertility in a mammal in which the pituitary gonadotropes have been selectively destroyed by administration of GRRH or 1-LHRH-III. This sequence also has applications in methods for killing, or inhibiting growth of hormone or ligand-dependent tumours by administering the carivity of which is dependent on binding of a cell-surface receptor to a riepard by administering the activity of which is dependent on binding of a cell-surface receptor to a rigand by administering the ligand and lytic peptide, inhibiting reproductive capacity of an insect by administration of a lytic peptide. Rusion proteins combining such proteins and lytic peptides can be fused and any also include a carrier domain, specifically vitamin Bl2, that facilitates incestinal uptake after oral administration. These methods have applications for increasing the growth rate of mammals, for pest contrains on the treatment of ovarian, breast, prostate, endommetrial or testicular cancers, prolactionma, growth hormone.
                                                                                                                                                                                                                                                                                   GnHR, lytic peptide, rat, gonadotrophin-releasing hormone; contraception, sterility, luteinising hormone; LH, l-LHRH-III, fertility, pituitary; lamprey-luteinising hormone-releasing hormone; gonadotropes; inhibitor; tumour; ligand; fueion protein; reproductive capacity, insect; treatment; growth rate; pest control; L-hecate; cancer; adenoma; lymphocyte;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New fusion of hormone and lytic peptide for selective cell killing particularly for controlling fertility in animals, insect pests, fish etc., also for treatment of hormone-dependent cancer, viral infections and auto-immune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Μ.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents chicken luteinising hormone releasing hormone (C-LiRRH-II). The specification describes a peptide isolated from Lamprey, 1-LiRRH-III, that is identical with, or very similar to, the mammalian follicle-stimulating hormone (FSH) -releasing factor. 1-LiRH-III causes a selective change in serum FSH levels but not a proportional tenage in serum levels of LH (luteinising hormone). The peptide and its agonists (see AAW96769-95) can be used to increase the level of FSH in vertebrates, and so are used to increase fertility, in males or females, particularly in humans but also in other mammals and fish. Antagonists of FSH, and so are used to decrease fertility by inhibiting spermatogenesis and follicular/ovarian development
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Selectively altering levels of follicle stimulating hormone in vertebrates - using lamprey luteinising hormone releasing-hormone and its derivatives, for increasing or reducing fertility.

The specification also describes peptides derived from 1-luteinising hormone releasing hormone (LHRH) -III, estrogen, testocererone luteinising hormone, chorionic gonadotropin, estrogen, testocererone luteinising hormone, chorionic gonadotropin, dopamine, semators testimulating hormone, estradiol, dopamine, somatostatin, and analogues of these hormones. The peptides are used in a compound, in conjunction with a lytic peptide. The compounds can be used for specifically inhibiting cells that are driven by or are dependent on specific ligand interactions. They can be used for providing long-term contraception or sterilisation in humans, domesticated or wild mammals. But septimes, amphibians, bony fish, cartilagainous fish, jawless fish, and invertebrates such as insects or molluscs. They can also be used for inhibiting or killing malignant and non-malignant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New hormone-lytic peptide compounds - used for long-term contraception or sterilisation, for killing insects or virally infected cells or for treating tumours or autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Hormone domain; gonadotropin releasing hormone; GnRH;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents a gonadotrophin-releasing hormone (GnRH) IIrcalted peptide. GnRH is released by the hypothalamus and acts on the pituitary to stimulate the release of lutenizing hormone and follicle stimulating hormone. GnRH is capable of modulating the differentiation of bone precursor cells, and inducing the expansion of osteoblast populations. The peptide can be used in compositions for treating osteoporosis (and other diseases of bone metabolism) and for the acceleration of bone repair. The compositions have osteogenic activity. The compositions are used to treat or prevent osteoporosis, other disorders of bone metabolism (e.g. osteogenesis imperfects, osteomalacia or bone loss resulting from prolonged periods of immobility), and to accelerate bone growth and repair (e.g. for healing fractures)
hormone-dependent tumours, for treating other hormone-related diseases, for selectively killing virally infected cells or for treating autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Composition containing gonadotropin-releasing hormone II peptide, useful e.g. for treating osteoporosis and for accelerating bone repair.

The present sequence is GnRH-II, a peptide with homology to gonadotrophin releasing hormone (GnRH, otherwise known as luteinising hormone releasing hormone. LiRRH). GNRH-II influences osteogenesis and modulates the proliferation of prostatic epithelial cells and so may be useful for treating human disease associated with abnormal bone and prostate growth. A biodegradable polymer is used to hold the peptide in a depot, from which the peptide is released into the systemic circulation at a controlled rate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pharmaceutical composition for treating bone and prostrate disorders comprises a peptide microencapsulated within a biodegradable polymer

                                                                                                                                                                                                                                                               The present sequence is that of chicken gonadotropin releasing hormone II (cGnRH-II). The present invention provides a means of producing biologically active peptides, such as cGnRH-II, by recombinant expression in microbial hosts. This involves the construction of a DNA cassette (see AA294528) comprising tandem repeating units of a nucleotide sequence ancoding the peptide and a linker. The DNA cassette is incorporated into a vector, and the peptide and a linker multimer is expressed in transformed microbial cells. The linkers are designed to include sites cleavable by a protease or chemical agent. Cleavage of the expressed multimer using the protease or chemical agent provides the biologically active peptide. (Updated on 12-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                              New DNA cassette comprising tandem repeating units of a nucleotide sequence encoding a biologically active peptide and a linker peptide used for producing the biologically active peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Luteinising hormone releasing hormone (LH-RH) related peptide SEQ ID:136.

The present invention describes a modified therapeutic peptide (1) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidy) and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids.

(I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body.

Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases

infe) and specificity as bonding to large molecules decreases

contracellular uptake and interference with physiological processes.

ARB90829 to AAB9241 represent peptides which can be used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                  Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gonadotropin-releasing hormone precursor peptide related peptide #3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gonadotropin-releasing hormone precursor peptide; GnRH; octopus; gonadotropin-releasing hormone; signal processing mechanism; drug; nerve system; pesticide; cardiant.

                                                                                                                                                                                                                         hormone (GRRH) activity comprising the sequence: pGlu-Zaa-Zaa-His-Zaa-Sez-Zaa-Zaa-Zaa-Pro-Gly-NH2 (I), where pGlu = pyroglutamic acid and Zaa = any amino acid. Peptides with GnRH activity also have cardiant processing mechanisms in the nerve system and in developing pesticides and drugs for e.g. potentiating heart beat and in developing pesticides and drugs for e.g. potentiating heart beat and breeding and farming young octopuses. The present sequence represents a peptide which is used in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Altering the secretion level of follicle-stimulating hormone in a vertebrate mammal comprises using peptide 1-luteinizing hormone releasing

They can be used for inducing breeding in fishes both in combination and alone by activating production of gonadotropin. The GRRH oppitde undGRH is and muGRH in have the amino acid sequences Gln-His-Trp-Ser-Arg-Leu-Pro-Gly (I) and Gln-His-Trp-Ser-Trp-Oly-Ile-Leu-Pro-Gly (II), respectively. Also described: (1) isolating and sequencing
                                                 The patent discloses compositions and methods for selectively stimulating on inhibiting the release of follicle stimulating hormone (FSB) from the anterior lobe of pitulitary gland. The method involves administration of a peptide-1-luteinising hormone releasing hormone (LHRH)-III, a potent FSH-releasing factor. LHRH is also called as gonadortorphin releasing hormone (GDRH). LHRH and its agonists may be used to enhance fertility. Antagonists to LHRH-III may be used to inhibit fertility. The method is a made for altering the secretion level of FSH in a vertebrate animal e.g. a mammal such as a male and female human. The present sequence is chicken luteinising hormone (c-LHRH) peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        gonadotropin releasing hormone; GnRH; muGnRH I; muGnRH II; Indian Murrel; fish; fish breeding; gonadotropin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New gonadotropin releasing hormones muGnRH I and muGnRH II useful induced breeding in fishes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

The method comprising providing to the T-cell population a molecule that is selected to be capable of modifyring an activity or expression level of a gonadotropin releasing hormone (GnRH)-I or a GnRH-I receptor to regulate GnRH-I or a GnRH-II mediated activity of a T-cell population. The method is useful for treating or preventing a T-cell related disease or condition characterised by abnormal T-cell activity, e.g. congenital immune deficiencies, acquired immune deficiencies, infection, psychopathology or neoplastic disease, autoimmune, allergic, hyperreactive, pathopsychological and neurological diseases and
muGnRH I and muGnRH II; and (2) inducing breeding in fishes using GnRH comprising exposing fishes to GnRH to help release gonadorropin, and inducing breeding in fishes using the gonadorropin. The present sequence represents a GnRH amino acid sequence given in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gonadotropin releasing hormone, GnRH-I; GnRH-II; T-cell related disease, congenital immune deficiency; acquired immune deficiency; hyperreactive; psychopathology; neoplastic disease, autoimmune disease, neuroprotective; pathopsychological disease, neurological disease; allograft rejection; graft-versue-host disease; allograft rejection; cytostatic; antl-HIV; allergic; gene therapy; chicken.

The method comprising providing to the T-cell population a molecule that is selected to be capable of modifying an activity or expression level of a gonadotropin releasing hormone (GnRH)-I or a GnRH-II mediated activity of a T-cell population. The method is useful for treating or preventing a T-cell population. The method is useful for treating or preventing a T-cell related disease or condition characterised by abnormal T-cell activity, e.g. congenital immune deficiencies, acquired immune deficiencies, infection, psychopathology or neoplastic disease, autoimmune, allergic, hyperreactive, pathopsychological and neurological diseases and conditions, graft-versus-host disease, or allograft rejections. The invention is useful in gene therapy. The present sequence is catfish gonadotropin releasing hormone (GnRH-II) peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Regulating activity of a T-cell population by providing a molecule that is capable of modifying an activity or expression level of GnRH-I or GnRH-II receptor to regulate GnRH-I or a GnRH-II mediated activity of the T-cell population.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gonadotropin releasing hormone; GnRH-I; GnRH-II; T-cell related disease; congenital immune deficiency; acquired immune deficiency; hyperreactive; psychopathology; neoplastic disease; autoimmune disease; neuroprotective; pathopsychological disease; neurological disease; allograft rejection; graft-versus-host disease; allograft rejection; cytostatic; anti-HIV; allergic; gene therapy; catfish.
conditions, graft-versus-host disease, or allograft rejections. The invention is useful in gene therapy. The present sequence is chicken gonadotropin releasing hormone (cGnRH-II) peptide
                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                 African catfish gonadotropin releasing hormone (GnRH-II) peptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of altering the level of secretion of follicle-stimulating hormone (FSH) in a vertebrate animal, involving administering a peptide to cause a selective change in serum FSH level, but does not cause change in serum luteinising hormone (LH) level of animal. The peptide is chosen from "luteinising hormone releasing canneal. The peptide is chosen from "luteinising hormone releasing hormone (LHRH)-III agonist peptide, 1-LHRH-III superagonist peptide, 1-LHRH-III which has been show to be an ESH-releasing factor (FSH-RH). Also included is a pharmaceutical composition comprising a peptide, which causes a selective change in serum FSH level, but does not cause change in serum luteinising hormone (LH) level of animal. The method is useful for altering the level of secretion of FSH in a vertebrate animal, preferably mammal or human (male or female), and for increasing or decreasing fertility of the vertebrate. The method is also applicable to other vertebrates to increase fertility, for e.g. sheep, cattle, pigs, chickens, turkeys, channel catfish, inlapia and koi. Treatment of farm animals with FSH-releasing factor leads to maturation of increased numbers of ovvarian follicles and subsequent convalutions, leading to increased litter sizes. The present sequence is an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is that of a chicken gonadotropin releasing hormone II (cGnRH-II) analogue comprising cGnRH-II (see AAY79309) and a Cterminal linker-derived Gly-Lys sequence. The analogue is produced by expression of a DNA cassette in a microbial host cell. The DNA cassette comprises tandem repeating units of a nucleotide sequence encoding cGnRH-II and trypsin cleavable linker peptides. The DNA cassette is incorporated into a vector, and the peptide-linker multimer is expressed in transformed microbial cells. Cleavage of the expressed microbial cells. Cleavage of the expressed multimer standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  .

The present sequence is that of a peptide comprising chicken gonadotropin releasing hormone II (cGnRH-II) flanked by 2 trypsin cleavable linker and used in the construction of a claimed bnA cassette (see AA294529) encoding the peptide was designed encoding 4 tandem repeats of cGnRH-II-linker units. The present invention provides a means of producing biologically active peptides, such as cGnRH-II, by recombinant expression in microbial hosts. This involves the construction of a DNA cassette comprising tandem repeating units of a nucleotide sequence encoding the peptide and a linker. The DNA cassette is incorporated into a vector, and the peptide-linker multimer is expressed in transformed microbial cells. The linkers are designed to expressed multimer using the protease or chemical agent. Cleavage of the biologically active peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New DNA cassette comprising tandem repeating units of a nucleotide sequence encoding a biologically active peptide and a linker peptide used for producing the biologically active peptide.
                                                                                                                                  Gonadotropin releasing hormone II; chicken; cGnRH-II; GnRH-II.

Regulating activity of a T-cell population by providing a molecule that is capable of modifying an activity or expression level of GnRH-I or GnRH-II receptor to regulate GnRH-I or a GnRH-II mediated activity of the T-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method for regulating activity of a T-cell population. The method comprising providing to the T-cell population a molecule that is selected to be capable of modifying an activity of expression level of a gonadotropin releasing hormone (GnRH) I or a GnRH-II mediated activity of a T-cell population. The method is useful for treating or preventing a T-cell related disease or condition characterised by abnormal T-cell activity, e.g. compensation immune deficiencies, acquired immune deficiencies, infection, psychopathology or neoplastic disease, autoimmune, allergic, hyperreactive, pathopsychological and neurological diseases and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gonadotropin releasing hormone, GnRH-I; GnRH-II; T-cell related disease, congenital immune deficiency, acquired immune deficiency, hyperreactive; psychopathology; neoplastic disease, autoimmune disease; neuroprotective, pathopsychological disease; neurological disease, allograft rejection, graft-versus-host disease, allograft rejection, cytostatic, anti-HIV; allergic, gene therapy; pacific herring.
claimed DNA cassette (see AA294528). Incorporation of the DNA cassette into a vector and transformation of a microbial host call provides a means for producing the polygeptide, which can then be cleaved with trypsin to produce biologically active cdnRH-II. The invention relates penerally to DNA cassettes encoding multimers of a biologically active peptide and a cleavable linker, and their use in production of biologically active peptides in microbial hosts. The linker peptides are preferably cleavable by a protease (e.g. asparaginylendopeptidase, trypsin, Achromobacter protease I. Staphylococcus aureus V8 protease, tTEV protease or Factor-Xa) or chemical agent
                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pacific herring gonadotropin releasing hormone (GnRH-II) peptide.

The method comprising providing to the T-cell population a molecule that is selected to be capable of modifying an activity or expression level of a gonadotropin releasing hormone (GRRH)-I or a GRRH-II receptor to regulate GRRH-I or a GRRH-II mediated activity of a T-cell population. The method is useful for treating or preventing a T-cell related disease or condition characterised by abnormal T-cell activity, e.g. congenital immune deficiencies, acquired immune deficiencies, infection, psychopathology or neoplastic disease, autoimmune, allergic, hyperreactive, pathopsychological and neurological diseases and conditions, graft-versus-host disease, or allograft rejections. The invention is useful in gene thdisease, or allograft rejections. The diseasent sequence is spiny dogilsh gonadotropin releasing hormone (GRRH-II) peptide

cDNA derived from mRNA isolated from treeshrew brain was amplified by PCR using primers based on (His5,Trp7,Tyr8) GnRH sequences. New primers were then generated for use in RACE, and the sequence of preprohormone cDNA was obtd. by aligning overlapping regions from consensus 5'RACE templates. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /note= "Ala at this position is replaced with Val due to single nucleotide polymorphism (SNP)"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cDNA derived from RNA isolated from ventral portions of H. burtoni brain was amplified by PCR using primers based on (His5,Trp7,Tyr8)-GnRH sequences. The PCR product was used to probe a H. burtoni ventral brain cDNA library in lamda-gt10 to isolate a full-length cDNA clone encoding the preprohormone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                          The invention relates to genetic variants of human gonadotropin-releasing hormone 2 (GNRH2) gene. The invention also relates to compositions and methods for haplotyping and/or genotyping the GNRH2 gene in an individual. Polymudeotides of the invention are useful for studying the expression and function of GNRH2 and in expressing GNRH2 proteins for use in screening candidate drugs to treat diseases related to GNRH2 activity. They are also used in gene therapy. The methods of the invention are useful in determining whether an individual has a haplotype of haplotype pairs. The haplotyping method is useful for improving the efficiency and reliability of seases associated with GNRH2 development of drugs for treating diseases associated with GNRH2 contributed in the discovery and activity, e.g., reproductive disorders. The present sequence is human
                                                                                                                                                                                                                         New genetic variants of gonadotropin-releasing hormone 2 isogene, useful in studying expression and function of protein and for screening drugs to treat diseases e.g. reproduction disorders.

New gonadotropin-releasing hormone 2 (GNRH2) polypeptide encoded by genetic variants having polymorphisms in the GNRH2 gene, for studying the function of, and treating disorders, such as, reproductive disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to gonadotropin-releasing hormone 2 (GNRH2) and its nucleic acid sequence. Polymorphic variants of the GNRH2 gene are useful in studying the expression and function of GNRH2, and in expressing GNRH2 proteins for use in screening candidate drugs for treating diseases associated with GNRH2 activity, such as reproductive disorders. Polymucleotides comprising a polymorphic gene variant or fragment may be used for therapeutic purposes, where a patient could benefit from expression or increased expression of a particular GNRH2 protein isoform, or an expression vector encoding the isoform may be administered to the patient. Haplotype information is useful in improving the efficiency and output of several steps in a drug discovery and development process, including target validation, identifying lead compounds, and early phase clinical trials. GNRH2 gene is used in gene therapy. The present sequence is human GNRH2 protein. GNRH2 gene is located at chromosome pl3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gonadotropin releasing hormone, GRRH; sbGnRH; gonadoliberin, spawning; ovulation; fish farming; transgenic fish; seabream.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

The peptide was synthesized with D-amino acids. It will be useful for hypogonadotropic hypogonadal men, male infertility, precocious puberty; and mammary and prostatic carcinomas. It will also be useful for development of assay for veterinary medicine. See also AAPB1573-81. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Deca:peptide luteinising hormone releasing hormone analogues - contain natural amino acids and have high activities for releasing luteinising hormone and FSH.
                                                                                                                                                                                                                                                                                                                                                                 Luteinising hormone releasing factor; follicle stimulating hormone; fertility; precocious puberty; mammary carcinoma; prostatic carcinoma.

                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The peptide was synthesized with D-amino acids. It will be useful for hypogonadotropic hypogonadal men, male infertility; precocious puberty; and mammary and prostatic carcinomas. It will also be useful for development of assay for veterinary medicine. See also AAP81573-82. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                        Novel seabream gonadotropin-releasing hormone and its analogues - useful for controlling gonadal development and spawning in fish.
                                                                                                                                                                              A seabream pitutary extract was subjected to HPLC. A fraction showing gonadotropin releasing hormone (GnRH) activity was subjected to pyroglutamyl aminopeptidase digestion and the peptide obtd. (AAR97761) was sequenced. The peptide, designated sbGnRH-II, was shown to be identical to the previously described chicken GnRH-II. sbGnRH is useful for controlling reproduction in fish
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Deca:peptide luteinising hormone releasing hormone analogues - contain natural amino acids and have high activities for releasing luteinising hormone and FSH.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Luteinising hormone releasing factor, follicle stimulating hormone, fertility, precocious puberty, mammary carcinoma, prostatic carcinoma.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a new salmon gonadotropin-releasing hormone (GRRH) decageptide analogue capable of binding to human chorionic, placental or ovarian GRH receptors and active in the presence of a post-proline peptidase or an endopeptidase. The analogue comprises a D-amino acid substitution at position of and an ethylamide or aza-Gly-amide cubstitution at position 10. The analogue is useful as a luteolytic, menses-inducing agents and/or post-coital contraceptive. It is useful to production, and has a direct effect on steroidogenesis at the ovary. It is useful in preparing a pharmaceuticals, as a menses-regulating agent, contraceptive or as an abortifacient. It is also useful for regulating to Groutzaceptive or as an abortifacient. It is also useful for regulating contraceptive or as an abortifacient. It is also useful for regulating agent. Contraceptive or as an abortifacient in the physiologic contraceptive of the decapeptide analogue to interact with the physiologic regulation of hGG, progesterone and prostaglandin during luteal phase of the cycle and early pregnancy, may be used to specifically interrupt luteal function and analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ó
                                                                                                                                                                                                                                                                                                                                                                        Novel salmon gonadotropin-releasing hormone decapeptide analog that binds to human chorionic, placental or ovarian gonadotropin-releasing hormone receptors, useful as luteolytic and/or post-coital contraceptive.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The peptide was synthesized with D-amino acids. It will be useful for hypogonadotropic hypogonadal men, male infertility; precocious puberty and mammary and prostatic carcinomas. It will also be useful for development of assay for veterinary medicine. See also AAPB1573-82. (Updated on 25-WAR-2003 to correct PA field.) (Updated on 25-WAR-2003)
Luteinising hormone releasing factor; follicle stimulating hormone; fertility; precocious puberty; mammary carcinoma; prostatic carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Luteinising hormone releasing factor; follicle stimulating hormone; fertility; precocious puberty; mammary carcinoma; prostatic carcinoma.

This peptide is a chimeric analogue of a naturally occuring vertebrate gonadotropin releasing hormone (GRH). It stimulates the release of GRHs from the pituitary of vertebrates. This activates gametogenesis and steroidogenesis in the gonads. It can be used to regulate eg the CNS, adrenals, gonads and mammary tissues. See also AAR11840-48 and AAR11850, (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New gonadotropin releasing hormone analogues - stimulate reproductive processes.

                                                                                                                                                                           ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      셤
                                                                                                                                                                                                                                                  ö
                                                                                                                The peptide was synthesized with D-amino acids. It will be useful for hypogonadotropic hypogonadal men, male infertility, precocious puberty; and mammary and prostatic carcinomas. It will also be useful for development of assay for veterinary medicine. See also AAP81574-82. (Updated on 25-WAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This peptide is a chimeric analogue of a naturally occuring vertebrate gonadotropin releasing hormone (GRH). It stimulates the release of GRHs from the pituitary of vertebrates. This activates gametogenesis and steroidogenesis in the gonads. It can be used to regulate eg the CNS, adrenals, gonads and mammary tissues. See also AAR11840-49. (Updated on 25-MAR-2003 to correct PF field.)
                                     veca:peptide luteinising hormone releasing hormone analogues - contain
natural amino acids and have high activities for releasing luteinising
hormone and FSH.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           gonadotropin releasing hormone analogues - stimulate reproductive

appoposis and tumour regression. GarH analogues are also useful for producing antibodies that specifically bind to non-mammalian GaRH peptide sequences or to tumour tissues or any other non-pituitary GaRH peptide or protein, for the treatment of proliferative disorders. This sequence represents a chicken II GaRH analogue peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Chicken, gonadotropin releasing hormone, postcoital contraceptive agent, GnRH; pregnancy; ovarian cyst, endometriosis, polycystic ovarian disease, leimyomas; luteolytic agent, fertility regulation, menses-inducing agent, abpormal uterine bleeding, abnormal pregnancy; trophoblastic disease; ectopic pregnancy; molar pregnancy; human chorionic gonadotropin, hGG, abortion; gynaecological; cytostatic; abortifacient; contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          gonadotropin-releasing hormone (GARH) analogue for regulating tumour GAR activity, where the analogue is capable of binding to extra-pituitary GARH receptors expressed on tumour tissues. The analogue has a greater binding affinity than mammalian GARH and is resistant to degradation by post-proline peptidases, particularly those found around tumour tissues, and endopeptidases found circulating in the blood GARH analogues are useful for regulating tumour activity by acting as superagonists at tumour tissue, leading to tissue receptor down regulation. The peptides act to reduce tumour cell proliferation and metastasis and can induce
                                                                                                                                                                                                                                                                                                                                                                                                                           hormone analog capable of binding greater affinity and resistant to useful in tumor growth regulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           invention relates to a composition comprising a non-mammalian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /note= "Pyroglutamic acid; Encoded by CAG"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         89.0%; Score 65; DB 4; Length 10; 90.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  gonadotropin releasing hormone; GnRH; muGnRH I; muGnRH II; Indian Murrel;
fish; fish breeding; gonadotropin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               analogues of gonadotropin releasing hormone (GRRH) capable of binding to ovarian, tubal, endometrial, uterine, prostate or testicular GRRH receptors and active in the presence of a post-proline peptidase or an endopeptidase. Sequences of the invention are useful for requiating and treating a condition of the ovaries, fallopian tubes, uterus, prostate, endometrium, testicles or tissues of pregnancy in a patient or animal. They are useful in various treatment methods as a contraceptive or post-coital contraceptive agent, for maintaining pregnancy when used in very low doses and administered in pulsatile fashion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               invention are useful in the preparations for the treatment of ovarian cysts, endometriosis and leimyomas. They are useful as luteolytic agents, no fertility regulation, as menses inducing agents and the management of ovarian cyst, polycystic ovarian disease, abnormal uterine bleeding, in vitro fertilisation protocols, abnormal pregnancies, ectopic pregnancies, molar pregnancies and trophoblastic disease. Sequences of the invention regulate human chorionic gonadctropin (RGZ) production and thus the progesterone production in pregnancy and is useful in the management of threatened abortion or the induction of abortions. The present sequence is an alternative version of chicken GnHR decapeptide. Note: This sequence is stated to be the same as that shown as SEQ ID NO: 2 in page 19 (claim 1 and claim 4) of the specification. However the sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel non-mammalian gonadotropin releasing hormone analogs useful to regulate reproductive functions and disorders, as menses regulators, contraceptives or abortifacients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to novel non-mammalian peptide hormone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

```
The present invention describes gonadotropin releasing hormones (GRRH) mugnRH II (ADA88923) and muGnRH II (ADA88924), isolated from Indian Murrel fish. They can be used for inducing breeding in fishes both in combination and alone by activating production of gonadotropin. The GRRH serial and muGnRH II have the amino acid sequences Gln-His-Trp-Ser-Alla-Trp-Arg-Leu-Pro-Gly (I) and Gln-His-Trp-Ser-Trp-Gly-Ile-Leu-Pro-Gly (II), respectively. Also described: (I) isolating and sequencing muGnRH I and muGnRH II; and (2) inducing breeding in fishes using GnRH comprising exposing fishes to GnRH to help release gonadotropin, and inducing breeding in fishes using the peacest sequence represents a GnRH amino acid sequence given in the exemplification of the

```
The peptide was synthesized with D-amino acids. It will be useful for hypogonadotropic hypogonadal men, male infertility; precocious puberty; and mammary and prostatic carcinomas. It will also be useful for development of assay for veterinary medicine. See also AAP81573-82. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Composition containing gonadotropin-releasing hormone II peptide, usefule.
                                                                                           Deca:peptide luteinising hormone releasing hormone analogues - contain natural amino acids and have high activities for releasing luteinising hormone and FSH.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents a gonadotrophin-releasing hormone (GnRH) II-related peptide. GnRH is released by the hypothalamus and acts on the pituitary to stimulate the release of lutenizing hormone and follicle

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô
                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method for regulating activity of a T-cell population. The method comprising providing to the T-cell population a molecule that is selected to be capable of modifying an activity or expression level of a gonadotropin releasing hormone (GnRH)-I or a GnRH-I or a GnRH-II mediated activity of a T-cell population. The method is useful for treating or preventing a T-cell related disease or condition characterised by abnormal T-cell activity, of a GnRH-I or the method is useful for treating or preventing a T-cell related disease or condition neoplastic disease, autoimmune, allergic, hyperreactive, pathopsychological and neurological diseases and conditions, graftversus-host disease, or allograft rejections. The invention is useful in gene therapy. The present sequence is dogfish gonadotropin releasing hormone (dfGnRH) peptide
                                                                                                                                                                                                                                                                                                     Regulating activity of a T-cell population by providing a molecule that is capable of modifying an activity or expression level of GnRH-I or GnRH-II receptor to regulate GnRH-I or a GnRH-II mediated activity of the T-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Luteinising hormone releasing factor; follicle stimulating hormone;

stimulating hormone. GRRH is capable of modulating the differentiation of bone precursor cells, and inducing the expansion of osteoblast populations. The peptide can be used in compositions for treating osteoporosis (and other diseases of bone metabolism) and for the acceleration of bone repair. The compositions have osteogenic activity. The compositions are used to treat or prevent osteoporosis, other disorders of bone metabolism (e.g. osteogenesis imperfects, osteomalacia or bone loss resulting from prolonged periods of immobility), and to accelerate bone growth and repair (e.g. for healing fractures)
                                                                                                                                                                        Gaps

                                                                     The present sequence is GnRH-II, a peptide with homology to gonadotrophin releasing hormone (GnRH, otherwise known as luteinising hormone releasing hormone, LHRH). GnRH-II influences osteogeneeis and modulates the proliferation of prostatic epithelial cells and so may be useful for treating human disease associated with abnormal bone and prostate growth. A biodegradable polymer is used to hold the peptide in a depot, from which the peptide is released into the systemic circulation at a controlled rate. The peptide was first prepared in the present resinbound protected form and was then cleaved and deprotected to produce a form suitable for use as a therapeutic agent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Regulating activity of a T-cell population by providing a molecule that is capable of modifying an activity or expression level of GnRH-I or GnRH-II receptor to regulate GnRH-I or a GnRH-II mediated activity of the T-cell population.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method for regulating activity of a T-cell population. The method comprising providing to the T-cell population a molecule that is selected to be capable of modifying an activity or expression level of a gonadotropin releasing hormone (GnRH)-I or a GnRH-II receptor to regulate GnRH-I or a GnRH-II mediated activity of a T-cell population. The method is useful for treating or preventing a T-cell related disease or condition characterised by abnormal T-cell activity,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gonadotropin releasing hormone, GnRH-I, GnRH-II, T-cell related disease, congenital immune deficiency; acquired immune deficiency; hyperreactive; psychopathology; neoplastic disease, autoimmune disease, neuroprotective; pathopsychological disease; neurogical disease; allograft rejection; graft-versus-host disease; allograft rejection; immunosuppressive; cytostatic; anti-HIV; allergic; gene therapy; spiny dogfish.
comprises a peptide microencapsulated within a biodegradable polymer.
                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Spiny dogfish gonadotropin releasing hormone (GnRH-I) peptide #1.

The method comprising providing to the T-cell population a molecule that is selected to be capable of modifying an activity or expression level of a gonadortopin releasing hormone (GnRH)-I or a GRH-II receptor to regulate GnRH-I or a GnRH-II mediated activity of a T-cell population. The method is useful for treating or preventing a T-cell related disease or condition characterised by abnormal T-cell activity, e.g. congenital immune deficiencies, acquired immune deficiencies, infection, psychopathology or neoplastic disease, autoimmune, allergic, hyperreactive, pathopsychological and neurological diseases and conditions, graft-versus-host disease, or allograft rejections. The invention is useful in gene therapy. The present sequence is spiny dogfish gonadotropin releasing hormone (GnRH-I) peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Regulating activity of a T-cell population by providing a molecule that is capable of modifying an activity or expression level of GnRH-I or GnRH-II receptor to regulate GnRH-I or a GnRH-II mediated activity of the T-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gonadotropin releasing hormone, GnRH-I; GnRH-II; T-cell related disease, congenital immune deficiency; acquired immune deficiency; hyperreactive; psychopathology; neoplastic disease, autoimmune disease, neuroprotective, pathopsychological disease; neurological disease; neurological disease; allograft rejection; graft-versus-host disease; allograft rejection; cytostatic; anti-HIV; allergic; gene therapy; spiny dogfish.

Peptides with GnRH activity also have cardiant activity. The peptides and their analogues can be used in studying signal processing mechanisms in the nerve system and in developing pesticides and drugs for e.g. potentiating heart beat and breeding and farming young octopuses. The present sequence represents a specifically claimed GnRH peptide from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New octopus brain-originated peptide with gonadotrophin-releasing hormone (GnRH) activity, useful in studying signal processing mechanism in nerve system and in developing pesticides and drugs, and breeding and farming
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                       Gonadotropin-releasing hormone precursor peptide, GnRH, octopus, gonadotropin-releasing hormone, signal processing mechanism, drug, nerve system, pesticide, cardiant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ò

The present invention relates to novel non-mammalian peptide hormone analogues of gonadotropin releasing hormone (GRRH) capable of binding to ovarian, tubal, endometrial, uterine, prosente or testicular GRRH receptors and active in the presence of a post-proline peptidase or an endopeptidase. Sequences of the invention are useful for regulating and treatment testiciles or tissues of pregnancy in a patient or animal. They are useful in various treatment methods as a contraceptive or post-coital contraceptive agent, for maintaining pregnancy when used in very coital contraceptive agent, for maintaining pregnancy when used in very coital contraceptive agent, for maintaining pregnancy when used in very invention are useful in the preparations for the treatment of ovarian cysts, endometriosis and leimyomas. They are useful as luteolytic agents, invention are useful in the preparations for the treatment of ovarian cyst, polycystic ovarian disease, abnormal uterine bleeding, in vitro fertilisation protocols, abnormal pregnancies, ectopic pregnancies, or molar pregnancies and trophoblastic disease. Sequences of the invention regulate human chorionic gonadortopin (hCG) production and thus the progesterone production in pregnancy and is useful in the management of threatened abortion or the induction of abortions and bortion or the induction of abortions and abortion or the same as that shown as SEQ ID NO: 2 in page 15 in feet.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel non-mammalian gonadotropin releasing hormone analogs useful to regulate reproductive functions and disorders, as menses regulators, contraceptives or abortifacients.
                                                                                                                                                             /note= "Aza-Gly; C-terminal amide; Encoded

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The peptide was synthesized with D-amino acids. It will be useful for hypogonadotropic hypogonadal men, male infertility; precocious puberty; and mammary and prostatic carcinomas. It will also be useful for development of assay for veterinary medicine. See also AAP81573-82. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Deca:peptide luteinising hormone releasing hormone analogues - contain natural amino acids and have high activities for releasing luteinising hormone and FSH.
                                                                                                                                                                                                                                                Luteinising hormone releasing factor; follicle stimulating hormone, fertility; precocious puberty; mammary carcinoma; prostatic carcinoma

The analogues of the invention are useful for controlling ovulation in fish, birds and mammals. They have higher activity than their natural counterparts. (Updated on 10-MAR-2003 to add missing OS field.) (Updated on 25-MAR-2003 to correct P field.)
                                                                                                                                                                                                                                                           New gonadoliberin analogues - useful for ovulation control in fish birds and mammals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GRH; gonadotropins; gametogenesis; steroidogenesis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The peptide of the invention has a potent effect on the reproduction processes of fish. Spawning of teleostei fish can be promoted by administration of effective amounts of the peptide. The peptide of the invention is effective at a level of less than about 10 micrograms per long grams of body weight, when administered to fish. It is considered to be effective in fish and in other vertebrates, including mammals and amphibians. (Updated on 25-WAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gonadotropin releasing hormone deca:peptide - for stimulating pituitary gland of fish to cause spawning.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This peptide is a chimeric analogue of a naturally occuring vertebrate gonadotropin releasing hormone (GRH). It stimulates the release of GRHs from the pituitary of vertebrates. This activates gametogenesis and steroidogenesis in the gonade. It can be used to regulate eg the CNS, adrenals, gonade and mammary tissues. See also AAR11840-43 and AAR11845-50. (Updated on 25-MAR-2003 to correct PF field.)

NiAlternate names: gonadorropin-releasing hormone
Species: Squalus acanthias (spiny dogfish)
(Species: Gyalus acanthias (spiny dogfish)
Cjate: 06-Jan-1995 #sequence (revision 06-Jan-1995 #text_change 20-Jan-2003
Cjates: Squalus acanthias (spiny dogfish)
Cjatession: B46030

Gradoliberin precursor - red sea bream

gonadoliberin precursor - red sea bream)

y.Alternate names: prepro-sGnRH

C,Species: Chrysophrys major (red sea bream)

R,Okuzawa, K.; Araki, K.; Tanaka, H.; Kagawa, H.; Hirose, K.

G, Arcession: Endocrinol. 96, 224-227, 1994

A,Title: Molecular cloning of a cDNA encoding the prepro-salmon gonadotropin-releasing hc

A,Reference number: IS1095; MUID:995154651; PMID:7851723

A;Accession: IS1095
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           C. A.Title: Structure of the extra-membranous domain of the beta-subunit of (Na,K)-ATPase A.Recession: A24303
A.Rocession: A24303
A.Molecule type: protein
A.Recibutes: 1-71 cohrs
C.Superfamily: Na+/K+-transporting ATPase beta chain
C.Keywords: hydrolase
            A;Residues: 1-10 cBUR>
A;Note: the natural and synthetic hormones have the same biological activity
C;Comment: This hypothalamic hormone stimulates the secretion of both luteinizing and C;Superfamily: gonadoliberin
C;Superfamily: gonadoliberin
C;Keywords: amidated carboxyl end; hormone; hypothalamus; pyroglutamic acid
F;1,Modified site: pyrrolidone carboxylic acid (Gln) #status experimental

RHRTG

gonadoliberin precursor - rat

N;Alternate names: gonadoliberin-associated protein (GAP); gonadotropin releasing hormon

N;Contains: gonadoliberin; prolactin release-inhibiting factor

C;Species: Rattus norvegicus (Norway rat)

C;Date: 31-Mar-1988 #sequence revision 31-Mar-1988 #text_change 18-Jun-1999

C;Accession: A40147; B26173; Ā48410
